

Sec 2.1 Sets

June 11, 2016 9:57 PM

Sec 2.1 Sets

Comp 232
Robert Mearns

1. What is a Set ?

a) Definition: A set is an un-ordered collection of objects.

Ex: students in this class or chairs in this room

b) Vocabulary and notation:

(i) The objects in a set are called the elements, or members of the set.

(ii) A set is said to contain its elements.

(iii) A set is denoted by an uppercase letter, the elements denoted by a lowercase letter.

(iv) The notation $a \in A$ denotes that a is an element of the set A .

(v) The notation $\neg (a \in A) \equiv a \notin A$ (\notin means "not contained in")

(vi) Set elements are usually enclosed with brace brackets $\{ \}$

2. Three ways to define the elements of a set:

a) Listing the elements:

Ex:

$S = \{a,b,c,d\} = \{a,b,c,d\}$	Order of element listing does not change set. Order does not matter.
$S = \{a,b,c,d\} = \{a,b,c,b,c,d\}$	Listing an element more than once does not change the set.
$S = \{a,b,c,d, \dots, z\}$	Run on dots called Elipses (...), may be used to describe a set without listing all of the members when the pattern is clear.

 Panda2ici
panda2ici@gmail.com

b) Set Builder notation:

- Specifies the property or properties that all set members must have.
- Use notation $A = \{x \mid \text{_____}\}$ (fill in the blank with the properties)
- Read as: “A = set of all x such that _____” (| means such that)

Set Builder	List elements
$S = \{x \mid x \text{ is a positive integer less than } 100\}$	$S = \{1, 2, 3, \dots, 99\}$
$S = \{x \mid x \text{ is an odd positive integer less than } 10\}$	$S = \{1, 3, 5, \dots, 9\}$
$S = \{x \mid x \text{ is perfect square } < 100\}$	$S = \{1, 4, 9, 16, \dots, 81\}$
A predicate may be used: $S = \{x \mid P(x), P(x): x < 6, \text{Domain is } Z\}$	
	$S = \{\dots, -1, 0, 1, 2, 3, 4, 5\}$

c) Describe with words:

Words	List or Set Builder
Set of Natural numbers with zero	$N = \{0, 1, 2, 3, \dots\}$
Set of Integers	$Z = \{\dots, -3, -2, -1, 0, 1, 2, 3, \dots\}$
Set of positive Integers	$Z^+ = \{1, 2, 3, \dots\}$
Set of Rational numbers	$Q = \{x \mid x = p/q, p, q \in Z, q \neq 0\}$
Set of Irrational numbers	$Irr = \{x \mid x \in R \wedge x \notin Q\}$ (is non repeating, non terminating when written as a decimal)
Set of Real numbers	$R = \{x \mid x \in Q \text{ or } x \in Irr\}$
Set of Complex numbers	$C = \{x \mid x = a + bi, a, b \in R, i = \sqrt{-1}\}$

3

3. Universal Set

a) Definition: The Universal set U is the Domain

Universal set contains every element currently under consideration.

- b) The Universal set always exists. Sometimes we imply it exists without its listing or description.
c) Sometimes we explicitly state the values in the Universal set.

4. Empty Set

- a) The Empty set is the set that contains no elements.
b) The Empty set denoted by the Greek letter \emptyset (phi) or by $\{\}$

5. Venn Diagram

- a) A Venn diagram is a geometric representation of a set
b) The Venn diagram was invented by John Venn (1834-1923)

Ex: $V = \{a, e, i, o, u\}$

$U = \{\text{English alphabet characters}\}$

5

5. Some things to remember

- a) Sets can be elements of sets.

Ex: $\{\{1,2,3\}, a, \{b,c\}\}$

- b) The empty set is different from a set containing the empty set.

Ex: $\emptyset \neq \{\emptyset\}$

Why? $\emptyset = \{\}$ and $\{\emptyset\} = \{\{\}\}$

6. Subsets

- a) Definition: The set A is a subset of B, if and only if every element of A is also an element of B

- b) The notation $A \subseteq B$ is used to indicate that set A is a subset of set B.

- c) Definition written in symbols: $A \subseteq B$ if and only if $\forall x (x \in A \rightarrow x \in B)$

Theorem: $\emptyset \subseteq S$, for every set S By definition of subset \subseteq , we need to show: $a \in \emptyset \rightarrow a \in S$ is 1

Proof (Vacuous)

Consider the implication $a \in \emptyset \rightarrow a \in S$

$a \in \emptyset$ is False

Hence the implication $a \in \emptyset \rightarrow a \in S$ is True

$\emptyset \subseteq S$

QED

\emptyset has no elements
Truth Table for \rightarrow
Definition of subset

7. Showing a Set is or is not a Subset of another set

a) To prove $A \subseteq B$, show that $\forall x (x \in A \rightarrow x \in B)$ is True

b) To prove $A \not\subseteq B$, show that $\neg \forall x (x \in A \rightarrow x \in B)$ is True

$\exists x \neg (x \in A \rightarrow x \in B)$ is True

$\exists x \neg (\neg x \in A \vee x \in B)$ is True

$\exists x (\neg \neg x \in A \wedge \neg x \in B)$ is True

$\exists x (x \in A \wedge x \notin B)$ is True

Hence: find at least one $x \in A \wedge x \notin B$.

De Morgan for quant.

\rightarrow in terms of Or

De Morgan

Double neg. Equiv. for \neg

Counter Example

Ex: The set of all C.S. students at Concordia is a subset of all students at Concordia

The set of integers whose squares are < 10 is not a subset of the set of \mathbf{Z}^+

8. Equal Sets

a) Definition: Two sets are equal if and only if they have the same elements.

b) The notation $A = B$ is used to indicate that set A equals set B

c) Definition in symbols: $A = B$ if and only if $\forall x (x \in A \leftrightarrow x \in B)$.

Ex: $\{1, 3, 5\} = \{3, 5, 1\}$ Order does not change set

$\{1, 5, 5, 5, 3, 3, 1\} = \{1, 3, 5\}$ Repeating elements does not change set

d) Another way of expressing equality of sets. Use the logical equivalences below:

$A = B$ iff $\forall x (x \in A \leftrightarrow x \in B)$

$A = B$ iff $\forall x [(x \in A \rightarrow x \in B) \wedge (x \in B \rightarrow x \in A)]$

$A = B$ iff $\forall x (x \in A \rightarrow x \in B) \wedge \forall x (x \in B \rightarrow x \in A)$

$A = B$ iff $A \subseteq B \wedge B \subseteq A$

Definition of = sets

Def. of bi-conditional

$\forall x$ equivalence with \wedge

Definition of subset

9. Proper Subsets

- a) A is a proper subset of B iff $A \subseteq B$, and $A \neq B$
- b) A a proper subset of B is denoted $A \subset B$
- c) In symbols $A \subset B$ iff $\forall x [(x \in A \rightarrow x \in B) \wedge \exists x (x \in B \wedge x \notin A)]$
- d) Venn diagram for $A \subset B$:
 $\exists x (x \in B \wedge x \notin A)$

10. Set Cardinality

- a) Definition: If there are exactly n distinct (different) elements in S we say that S is finite. Otherwise S is infinite.
- b) Definition: The cardinality of a finite set A is the number of distinct elements of A.
- c) Cardinality of A is denoted $|A|$ or $n(A)$

Ex: $|\emptyset| = 0$ or $n(\emptyset) = 0$

Let S be the letters of the English alphabet then $|S| = 26$

$|\{1,2,3\}| = 3$

$|\{\emptyset\}| = 1$

The set of integers is infinite.

11. Cartesian Product Set: Invented by René Descartes (1596-1650)

a) Definition: The Cartesian Product of two sets A and B, is the set of :
ordered pairs (x, y) where $x \in A$ and $y \in B$

b) The Cartesian Product is denoted by $A \times B$

c) The set builder notation: $A \times B = \{(x, y) \mid (x \in A) \wedge (y \in B)\}$

Ex 1: If $A = \{1, 2, 3\}$ and $B = \{5, 6\}$ then $A \times B = \{(1,5),(1,6),(2,5),(2,6),(3,5),(3,6)\}$

Ex 2: The Cartesian products can be expanded beyond two sets

If $A = \{0,1\}$, $B = \{3\}$ and $C = \{0,1,2\}$

$A \times B \times C = \{(0,3,0),(0,3,1),(0,3,2),(1,3,0),(1,3,1),(1,3,2)\}$

12. Power Set

a) Definition: The power set of A is the set of all subsets of a set A

b) The Power set is denoted $P(A)$

Ex If $A = \{a,b\}$ then $P(A) = \{\emptyset, \{a\}, \{b\}, \{a,b\}\}$

c) If a set has n elements, then the cardinality of the power set is n^2

13. Truth Set

Definition: The Truth Set of $P(x)$ is the set of elements x in Domain D for which $P(x)$ is true.

b) The truth set of $P(x)$ is denoted by $\{x \in D \mid P(x)\}$

c) Ex: The truth set of $P(x)$ where the domain is the integers and $P(x)$ is " $|x| = 1$ " is $\{-1, 1\}$
